

# Service Status Management

The status of services can be communicated to users from the main service list in a given facility. This functionality provides the ability to visually communicate to users what the status of a given instrument/service is. Available statuses include:

- Disabled/Hidden - Feature Disabled, Don't show Status
- Functional - Shows a green dot next to the service icon

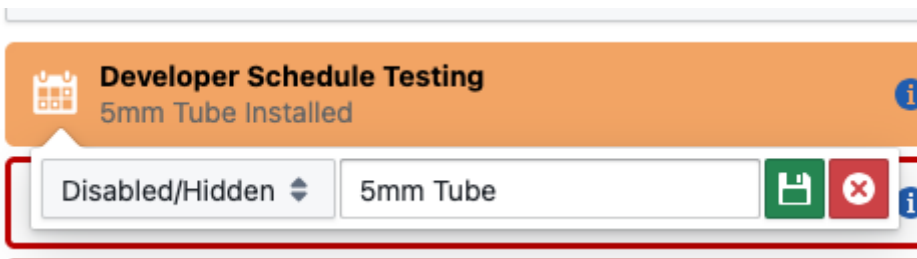

- Degraded - Shows a yellow warning icon next to the service icon. Hovering over the icon provides status message

- Disabled - Shows a red warning icon next to the service icon. Hovering over the icon provides status message

This functionality can be enabled/managed by clicking on the service icon for services you are a manager on. If you are not a manager you will be unable to access the feature.

For the degraded and disabled statuses users will also see a warning message at the top of their event details.

### Instrument Usage Documentation

**Warning: This service/instrument is currently reported as in degraded operational status. 5mm Tube**

Resource (required)

Setting the instrument status does NOT affect the user's ability to scheduled on a service. This function is for informational purposes only.
